Abstract

Herbal based test formulations have been used in most of the healthcare settings since time immemorial. The present experimental cell line study was designed to evaluate the impact of the Biofield Energy Treatment on different cell line mediums related with vital organs functioning. Cell lines that were specific to different organ systems were used in the study using standard protocols. The Test Item (TI) and specific cell line media (Med) was divided into two parts; one untreated (UT-TI) and other part received the Biofield Energy Treatment remotely by a renowned Biofield Energy Healer, Eileen Mary Meagher, USA and were labeled as the Biofield Energy Treated (BT) test formulation/media. MTT assay was used for cell viability assay, and the results showed that the test item was found non-toxic.

Cytoprotective action of the test formulation showed a significant maximum restoration of cell viability by 56.8% (at 63.75 µg/mL), 57.5% (at 63.75 µg/mL), and 124.8% (at 1 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group in Human Cardiac Fibroblasts cells (HCF) cells, while 93.2% (at 63.75 µg/mL), 93.8% (at 63.75 µg/mL), and 20.6% (at 10 µg/mL) improved cellular protection of human Hepatoma cells (HepG2) cells in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. In addition, cytoprotective action in adenoscinoma human alveolar basal epithelial cells (A549) showed improved cell viability by 11.3% (at 25.5 µg/mL), 82.7% (at 63.75 µg/mL), and 113.9% (at 25.5 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group.

Cytoprotective action of the test formulation showed a significant maximum restoration of cell viability by 21.7% (at 25.5 µg/mL), 56.8% (at 63.75 µg/mL), and 57.5% (at 63.75 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Besides, Ishikawa cells showed maximum increased ALP activity by 94.8% at 10 µg/mL in the BT-Med+UT-TI group as compared to the untreated test group. The maximum percent cellular protection of HCF (heart) cells (decreased of LDH activity) was significantly increased by 48.8% (at 1 µg/mL), 62.9% (at 10 µg/mL), and 103% (at 1 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Furthermore, Ishikawa cells showed maximum increased ALP activity by 94.8% at 10 µg/mL in the BT-Med+UT-TI group as compared to the untreated test group. The maximum percent cellular protection of hep2 (liver) cells (decreased of ALT activity) was reported at 63.75 µg/mL by 74.9% and 94.9% in the BT-Med+UT-TI and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Cellular protection of A549 (lung) cells (increased of SOD activity) in terms of percentage was increased by 21.7% (at 25.5 µg/mL), 83.2% (at 0.1 µg/mL), and 40% (at 25.5 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to untreated group.

Cytoprotective action of the test formulation showed a significant maximum restoration of cell viability by 50.8% (at 63.75 µg/mL), 35.9% (at 10 µg/mL), and 49.9% (at 10 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Serotonin level was significantly increased by 50.8% (at 63.75 µg/mL), 35.9% (at 10 µg/mL), and 49.9% (at 10 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. In human neuroblastoma cells (SH-SY5Y) increased cell viability by 135.2%, 291.4%, and 248.3% at 50 µg/mL in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. In human Lung (A549) cells increased cell viability by 21.7% (at 25.5 µg/mL), 56.8% (at 63.75 µg/mL), and 57.5% (at 63.75 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. In human liver (HepG2) cells increased cell viability by 21.7% (at 25.5 µg/mL), 56.8% (at 63.75 µg/mL), and 57.5% (at 63.75 µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group.
molecules [1]. With increasing development of the antibiotic’s era, popularity of herbal medicine among people was gradually decreased, due to fast therapeutic actions of synthetic drugs. But now-a-days, allopathic medicines have some limitations due to its adverse action [2]. However, herbal based test formulation has gained momentum in some cases as compared with the synthetic drugs. Besides, herbal based treatment approach, minerals, vitamins, and other vital constituents are also one of the treatment strategies in health care systems for powerful healing. Herbal system based pharmaceutical companies are continuing research on development of some unique formulations and are investing on research, development and popularizing such novel formulations. Herb mineral formulations are reported to be useful against overall health diseases such as high blood pressure, heart disease, asthma, other respiratory diseases, immunodeficiency diseases, aging and many more [3,4]. Thus, a novel herb mineral test formulation has been developed that would improve the overall functioning of multiple organs using standard cell line-based bioassay. However, till date no such scientific reports are available with respect to the herbal-based test formulation, which can improve the overall organ health. The novel test formulation was the combination of herbal products viz. panax ginseng extract and beta carotene, minerals viz. calcium chloride, magnesium gluconate, zinc chloride, sodium selenite, ferrous sulfate, and vitamins viz. vitamin B<sub>1</sub>, vitamin D<sub>3</sub>, ascorbic acid, and vitamin B<sub>6</sub>. This novel formulation was designed for improving overall organ function against various pathological conditions. Minerals and vitamins added in the test formulation are useful to support organ health and its functioning [5-8]. Panax ginseng overall improve wellness and thinking, memory, concentration, physical stamina, work efficiency, preventing muscle damage, Alzheimer’s disease, athletic endurance, improve mental and cognitive health, and is a potent immunomodulator [9,10]. The above novel combination of constituents was tested against specific organ-based cell lines that were tested for biological activities. The specific activities included bone health study using MG-63 cells, lung health study using A549 cells, liver health study using HepG2 cells, heat shock study using Human Cardiac fibroblasts, and neuronal health study using SH-SY5Y cells [11-20]. Before testing, the test formulation and the cell line specific media was treated with the complementary medicine i.e. Biofield Energy (The Trivedi Effect®-Consciousness Energy Healing) Treatment by a renowned Biofield Energy Healer.

Biofield Energy Treatment is one of the advanced Complementary and Alternative Treatment method, which has gained a strong scientific foundation using the concept of homodynamic regulation of living systems. Biofield Energy Healing Modalities as CAM approach is reported to be significantly useful to improve the overall physical, mental, and emotional human wellness [21-24] without any invasive procedures. Thus, Biofield Energy Treatment is one of the best unifying concepts between the traditional and contemporary explanatory energy models. The Trivedi Effect®-Consciousness Energy Healing has been accepted worldwide with significant results in the field of metal science [25,26], agriculture science [27], microbiology [28,29], biotechnology [30,31], and improved compounds bioavailability [32,33], dermatology [34,35], nutraceuticals [36], cancer research [37], bone health [38-40], human health and wellness. Due to the continued clinical and preclinical applications of Biofield Energy Healing Treatments, the test formulation was studied for impact of the Biofield Energy Healing Treated test formulation on the function of vital organs such as bones, heart, liver, lungs, and brain specific biomarkers in different standard cell-lines.

Materials and Methods

Chemicals and reagents

Calcium chloride, ferrous sulfate, vitamin B<sub>1</sub>, vitamin B<sub>12</sub>, vitamin D<sub>3</sub>, naringenin, Trimetazidine (TMZ), 3-(4,5-Dimethylthiazol-2-yl)-2,5-Diphenyltetrazolium Bromide (MTT), and Ethylene diamine tetraacetic acid (EDTA) were procured from Sigma Chemical Co. (St. Louis, MO). Magnesium gluconate, zinc chloride, β-carotene, and calcitriol were procured from TCI chemicals, Japan. Panax ginseng extract was obtained from panacea Phytoextracts, India. Sodium selenite and ascorbic acid were procured from Alfa Aesar, India. Silymarin and curcumin were procured from Sanat Chemicals, India, while quercetin was purchased from Clear synth, India. Reverse Transcription Kit, RNeasy Mini Kit, and Syber Green PCR kits were procured from Qiagen, India. All the other chemicals used in this experiment were analytical grade procured from India.

Biofield energy healing treatment

The test formulation was the combination of eleven ingredients viz. calcium chloride, panax ginseng extract, vitamin B<sub>13</sub>, β-carotene, vitamin D<sub>3</sub>, zinc chloride, magnesium gluconate, sodium selenite, ferrous sulfate, ascorbic acid, and vitamin B<sub>6</sub>. The test formulation/media was divided into two parts, as the untreated group, where no Biofield Energy Treatment was provided, while another part defined as Biofield Energy Healing Based test formulation/media. The untreated group was treated with a “sham” healer for comparison purposes, who did not have any knowledge about the Biofield Energy Healing Treatment. The rest constituents of the test formulation/media received Biofield Energy Treatment (The Trivedi Effect®) remotely by Eileen Mary Meagher, under standard laboratory conditions for ~3 minutes through healer’s unique Biofield Energy Transmission process and were referred as the Biofield Energy Treated formulation/media. The Biofield Energy Healer was located in the USA; however, the test formulation/media were located in the research laboratory of Dabur Research Foundation, New Delhi, India. Biofield Energy Healer in this experiment did not visit the laboratory, nor had any contact with the test samples. Further, Biofield Energy Treated and untreated test items were kept in similar sealed conditions and used for the study as per the study plan.

MTT test for cell viability assay

All the experimental cells used in this study were counted for cell viability using hemocytometer in 96-well plates at the specific density as mentioned in the Table 1. The cells were then incubated overnight under standard growth conditions to
allow cell recovery and exponential growth. Following overnight incubation, cells were treated with different concentrations of test formulations (BT/UT). After respective treatments, the cells were incubated in a CO_2 incubator at 37 °C, 5% CO_2, and 95% humidity. After incubation, the plates were taken out and 20µL of 5mg/ml of MTT 3-[4,5-dimethylthiazol-2-yl]-2,5-diphenyl tetrazolium bromide solution was added to all the wells followed by additional incubation for 3 hours at 37 °C. The supernatant was aspirated and 150µL of DMSO was added to each well to dissolve formazan crystals. The absorbance of each well was read at 540 nm using Synergy HT microplate reader. The percentage cytotoxicity at each tested concentration was calculated using Equation 1:

\[
\%\text{Cytotoxicity} = \left( \frac{R-X}{R} \right) \times 100 \]

Where, \( X \) = Absorbance of treated cells; \( R \) = Absorbance of untreated cells

The concentrations exhibiting percentage cytotoxicity <30% was considered as non-cytotoxic [41].

Cytoprotective effect of the test formulation

Cytoprotective effect of the test formulation in various cells such as human cardiac fibroblasts-HCF; human hepatoma cells-HepG2; and adenocarcinoma human alveolar basal epithelial cells-A549 were counted and plated in suitable medium followed by overnight incubation. Further, the cells were then treated with the test items/positive control at the non-cytotoxic concentrations for 24 hours. After 24 hours, the oxidative stress using 10mM t-BHP for 3.5 hours was given to the cells. The cells treated with 10mM of t-BHP alone served as negative control. After 3.5 hours of incubation with t-BHP, the above plates were taken out and cell viability was determined by MTT assay. The percentage protection corresponding to each treatment was calculated using equation 2:

\[
\%\text{Protection} = \left( \frac{[\text{Absorbance}_{\text{sample}} - \text{Absorbance}_{\text{t-BHP}}]}{\text{Absorbance}_{\text{untreated}} - \text{Absorbance}_{\text{t-BHP}}} \right) \times 100 \]

Estimation of alkaline phosphatase (ALP) activity

For the estimation of ALP, the cells (human bone osteosarcoma cells-MG-63 and human endometrial adenocarcinoma cells-Ishikawa) were counted using a hemocytometer and plated in 24-well plates at the density corresponding to 1X10^5 cells/well in phenol-free DMEM supplemented with 10% CD-FBS. Following the respective treatments, the cells were plated in the above plate were incubated for 48 hours in CO_2 incubator at 37 °C, 5% CO_2, and 95% humidity. After 48 hours of incubation, the plates were taken out and processed for the measurement of ALP enzyme activity. The cells were washed with 1XPBS and lysed by freeze-thaw method i.e., incubation at -80 °C for 20 minutes followed by incubation at 37 °C for 10 minutes. To the lysed cells, 50µL of substrate solution i.e. 5 mM of p-nitrophenyl phosphate (pNPP) in 1M diethanolamine and 0.24mM magnesium chloride (MgCl2) solution (pH=10.4) was added to all the wells followed by incubation for 1 hour at 37 °C. The absorbance of the above solution was read at 405nm using Synergy HT microplate reader (Biotek, USA). The absorbance values obtained were normalized with substrate blank (pNPP solution alone) absorbance values. The percentage increase in ALP enzyme activity with respect to the untreated cells (baseline group) was calculated using Equation 3:

\[
\%\text{Increase in ALP} = \left( \frac{\text{Absorbance}_{\text{test items}} - \text{Absorbance}_{\text{baseline}}}{\text{Absorbance}_{\text{baseline}}} \right) \times 100 \]

Where, \( X \) = Absorbance of treated cells; \( R \) = Absorbance of untreated cells

Estimation of lactate dehydrogenase (LDH) in human cardiac fibroblasts (HCF) cells

HCF cells were counted and plated at the density of 0.25X10^5 cells/well in 24-well plates in cardiac fibroblast specific medium followed by overnight incubation. The cells were then treated with the test formulation/combinations/positive control at the non-cytotoxic concentrations for 24 hours. After 24 hours, oxidative stress was given to the cells using 10mM t-BHP for 3.5 hours. The untreated cells were served as control group, which did not receive any treatment and were maintained in cell growth medium only. Cells treated with 10mM of t-BHP alone served as the negative control. After 3.5 hours of incubation with t-BHP, the above plates were taken out and LDH activity was determined using LDH activity kit as per manufacturer’s instructions. The percent increase in LDH activity was calculated using Equation 4.

\[
\%\text{Increase} = \left( \frac{\text{LDH activity}_{\text{sample}} - \text{LDH activity}_{\text{t-BHP}}}{\text{LDH activity}_{\text{untreated}} - \text{LDH activity}_{\text{t-BHP}}} \right) \times 100 \]

Estimation of ALT in liver cells (HepG2)

The human hepatoma cells (HepG2) were counted and plated at the density of 5X10^4 cells/well in 48-well plates in DMEM media followed by overnight incubation. The cells were then treated with the test formulation/positive control at the non-cytotoxic...
concentrations for 24 hours. After 24 hours, oxidative stress was given to the cells using 400µM t-BHP for 3.5 hours. The untreated cells served as control that did not receive any treatment and were maintained in cell growth medium only. Cells treated with 400µM of t-BHP alone served as negative control. After 3.5 hours of incubation with t-BHP, the above plates were taken out and ALT activity was determined using ALT activity kit as per manufacturer’s instructions. The percent increase in ALT activity was calculated using Equation 5.

\[
\% \text{ Increase} = \frac{[\text{ALT activity}_{\text{sample}} - \text{ALT activity}_{\text{t-BHP}}]^{*}100}{\text{ALT activity}_{\text{untreated}} - \text{ALT activity}_{\text{t-BHP}}} \quad (5)
\]

**Estimation of superoxide dismutase (SOD) in lung (A549) cells**

The adenocarcinoma human alveolar basal epithelial cells (A549) were counted and plated at the density of 1X10^4 cells/well in 24-well plates in DMEM followed by overnight incubation. The cells were then treated with the test formulation/positive control at the non-cytotoxic concentrations along with 100µM t-BHP to induce oxidative stress. The untreated cells served as control that did not receive any treatment and were maintained in cell growth medium only. Cells treated with 100µM of t-BHP alone served as negative control. After 24 hours of incubation with t-BHP the above plates were taken out and SOD activity was determined using SOD activity kit as per manufacturer’s instructions. The percent increase in SOD activity was calculated using equation 6:

\[
\% \text{ Increase in SOD activity} = \frac{\text{SOD activity}_{\text{treated}} - \text{SOD activity}_{\text{control}}}{\text{SOD activity}_{\text{control}}} \times 100 \quad (6)
\]

Where, X = SOD activity corresponding to test item or positive control

R = SOD activity corresponding to Control group.

**Estimation of serotonin in neuronal cells (SH-SY5Y)**

The human neuroblastoma (SH-SY5Y) cells were counted and plated at the density of 10 X 10^4 cells/well in 96-well plates followed by overnight incubation. The cells were then treated with the test formulation/positive control at the non-cytotoxic concentrations. The untreated cells served as control that did not receive any treatment and were maintained in cell growth medium only. The treated cells were incubated for 24 hours. Serotonin release was determined by ELISA as per manufacturer’s protocol. The percent increase in serotonin levels was calculated using equation 7:

\[
\% \text{ Increase in serotonin levels} = \frac{\text{Serotonin levels}_{\text{treated}} - \text{Serotonin levels}_{\text{control}}}{\text{Serotonin levels}_{\text{control}}} \times 100 \quad (7)
\]

Where, X = Serotonin levels corresponding to test item or positive control,

R = Serotonin levels corresponding to control group.

**Effect of test formulation on Vitamin D Receptor (VDR) in bone (MG-63) cells**

The effect of test formulation on vitamin D receptor (VDR) activity in bone (MG-63) cells were counted using the hemocytometer at density 2X10^5 cells/well in 6-well plates followed by overnight incubation. The cells were then sera starved for 24 hours and treated with the test formulation/positive control at the non-cytotoxic concentrations, while control group did not receive any treatment, which were maintained in cell growth medium only. The treated cells were incubated for 24 hours and VDR expression was determined by qPCR using VDR specific primers. Cells were harvested by scraping and washed with PBS. Cell pellets obtained were analyzed for VDR gene expression using human VDR specific primers: Forward: 5’-GCTGAAGCTGTCAGTTACAGCA-3’, Reverse: 5’-CAGTCATGACCGGTACCTT-3’. VDR gene expression was normalized using Housekeeping (HK) reference. Relative Quantification (RQ) of VDR gene in Biofield Energy Treated cells was calculated with respect to the untreated cells using equation 8:

\[
\text{RQ} = 2^{-\text{R}} \quad (8)
\]

Where, N is the relative Threshold Cycle (CT) value of treated sample with respect to the untreated sample.

**Statistical Analysis**

All the values were represented as mean±SD (Standard Deviation) of three independent experiments. The statistical analysis was performed using Sigma Plot statistical software (v11.0). For two group comparison, student’s t-test was used. For multiple group comparison, one-way analysis of variance (ANOVA) was used followed by post-hoc analysis by Dunnett’s test. Statistically significant values were set at the level of p≤0.05.

**Results and Discussion**

MTT assay for cell viability

MTT assay was used initially for analyzing cell viability at various test concentrations. The initial results of MTT assay revealed that each cell line was found safe with respect to the tested concentrations of test formulation and were represented as percentage of cell viability. The criteria for selection of non-cytotoxic concentrations were less than 30% cytotoxicity or greater than 70% cell viability using MTT assay. The experimental data suggested that the overall percent cell viability in different cell-lines viz. MG-63, Ishikawa, A549, HepG2, HCF, and SH-SY5Y. Based on the percent cell viability data, it was observed that the test formulation and positive controls were found safe and non-toxic at the tested concentrations. These test concentrations of the formulation were used cell-based assays.

**Evaluation of cytoprotective effect of the test formulation**

Cytoprotective action was tested on three cell lines. The experimental data represented in terms of percentage cellular protection against t-BHP induced cell damage and the results are shown in Figure 1. Trimetazidine (TMZ) was used as a positive control group in Human Cardiac Fibroblasts cells (HCF) for cytoprotective effect which showed significant restoration of cell viability by 48%, 57.2%, and 87.2% at 5, 10, and 25µM, respectively as compared to the t-BHP induced group. Besides, the restoration of cell viability among the tested groups by the test formulation was reported as 19.4%, 21.3%, and 56.8% at 10, 25, and 63.75µg/mL respectively, in the UT-Med+BTTI as compared with the untreated test group. Similarly, restoration of cell viability was increased in
BT-Med+UT-TI group was 25.5% and 57.5% at 25.5 and 63.75 µg/mL respectively, while increased cellular restoration was reported by 124.8%, 30%, 15.7%, and 63.2% at 1, 10, 25.5, and 63.75 µg/mL respectively in the BT-Med+BT-TI group as compared with the untreated test group. Similarly, silymarin was used as positive control in HepG2 cells, which resulted in significant cellular restoration by 40%, 65.9%, and 86.6% at 5, 10, and 25 µg/mL, respectively as compared to the t-BHP induced group. Besides, test formulation groups such as in the UT-Med+BT-TI group showed increased cellular restoration by 40.8%, 4.9%, and 83.2% at 1, 25.5, and 63.75 µg/mL respectively, as compared to the untreated test group. Besides, the test formulation showed maximum restoration of cell viability by 83.4%, 26.7%, and 93.8% at 10, 25.5, and 63.75 µg/mL respectively in the BT-Med+UT-TI group. Similarly, 20.6% improved cellular restoration was reported at 10 µg/mL in the BT-Med+BT-TI group as compared to the UT-Med+UT-TI group. In addition, quercetin was used as positive control in adenocarcinoma human alveolar basal epithelial cells (A549) resulted, restoration of cell viability by 56.8% and 66.4% at 10 and 25 µM, respectively compared to the t-BHP induced group. Besides, the test formulation showed maximum restoration of cell viability by 3.7%, 5%, 11.3%, and 9.6% at 1, 10, 25.5, and 63.75 µg/mL respectively, in the UT-Med+BT-TI group. Similarly, 57.3%, 12.2%, 15.5%, and 82.7% improved cellular restoration was reported at 1, 10, 25.5, and 63.75 µg/mL respectively, at BT-Med+UT-TI groups as compared to the UT-Med+UT-TI group. However, 33.2%, 92%, 113.9%, and 82.1% improved cellular restoration was reported at 1, 10, 25.5, and 63.75 µg/mL respectively, at BT-Med+BT-TI groups as compared to the UT-Med+UT-TI group. Cytoprotecting of cells against test formulation can be determined using tert-butyl hydroperoxide (t-BHP) method [41, 42]. Cytoprotecting defines the rate of cellular injuries and oxidative stress that can induce cell death [43-47]. The present experimental data showed significant improved cellular protection after Biofield Energy Healing Treatment (The Trivedi Effect®) against vital organs and their functioning viz. heart, liver, and lungs. Overall, it can be useful to manage the oxidative stress induced by various factors against pathological etiologies of cardiovascular, liver, and various lung diseases.

(HCF). Human Hepatoma Cells (HepG2), and adenocarcinoma human alveolar basal epithelial cells (A549) against tert-butyl hydroperoxide (t-BHP) induced damage. Trimetazidine (µM), silymarin (µg/mL), and quercetin (µM) were used as positive control in HCF, HepG2, and A549 cells, respectively. UT: Untreated; Med: Medium; BT: Biofield Treated; TI: Test Item.

Estimation of Alkaline Phosphatase (ALP) activity

ALP activity was evaluated using cell lines viz. MG-63 and Ishikawa cells. Naringenin was used as positive control for Ishikawa cells, and the data showed significant improved level of ALP by 18.3%, 35.8%, and 109.4% at 0.1, 1, and 10 µM respectively (Figure 2). However, the experimental test groups showed increased ALP activity by 59.8%, 24.5%, and 8.4% at 0.1, 1, and 50 µg/mL respectively, in the UT-Med+BT-TI group as compared to the UT-Med+UT-TI group in MG-63 cells. In addition, ALP activity was increased by 269.7%, 60.8%, and 59.7% at 0.1, 1, and 50 µg/mL respectively, in the BT-Med+UT-TI group as compared to the UT-Med+UT-TI group. Similarly, calcitriol (nM) was used as positive control in the MG-63 cells, and the results suggested significant increased ALP level by 12%, 23%, and 53.5% at 0.1, 1, and 10 nM respectively as presented in Figure 2. In the experimental tested groups, the ALP percent was significantly increased by 87.2% and 86.4% at 10 and 50 µg/mL, respectively in the UT-Med+BT-TI group as compared to the UT-Med + UT-TI group. Similarly, ALP percent was significantly increased by 94.2% and 89.4% at 10 and 50 µg/mL, respectively in the BT-Med+UT-TI group as compared to the UT-Med+UT-TI group. However, ALP percent was significantly increased by 9.4% and 83.4% at 10 and 50 µg/mL, respectively in the BT-Med+BT-TI group as compared to the UT-Med+UT-TI group. ALP is one of the best bone health biomarkers, however significant increased level denoted recovery in bone related disorders [48, 49]. Overall, the experimental data suggested significant improved ALP level after Biofield Energy Healing Treatment that has important application in low bone density, osteoporosis, osteogenesis imperfect and Paget’s disease of bone that makes the bones brittle.
Figure 2: Alkaline Phosphatase (ALP) activity in human bone osteosarcoma cells (MG-63) and human endometrial adenocarcinoma cells (Ishikawa) after treatment of the test formulation. Calcitriol and naringenin were used as positive control in MG-63 and Ishikawa cells, respectively.

UT: Untreated; Med: Medium; BT: Biofield Treated; TI: Test item

Identification of Lactate Dehydrogenase (LDH) activity in Human Cardiac Fibroblasts (HCF)

LDH activity was represented in terms of decreased LDH activity, which represents increased cellular protection of HCF cells (Figure 3). The positive control, Trimetazidine (TMZ) showed 63.1%, 92.3%, and 115.2% increased cellular protection of HCF cells (decreased of LDH activity) at 10, 50, and 100 µM concentration as compared to the t-BHP group. The test formulation showed maximum percent protection of HCF cells (decreased of LDH activity), which was significantly increased by 48.8%, 31.5%, and 44% at 1, 10, and 25.5 µg/mL concentrations respectively, in the UT-Med+BT-TI group, while 62.9% and 47% improved cellular protection (decreased of LDH activity) at 10 and 25.5 µg/mL respectively in the BT-Med+UT-TI group, and 103% and 99.9% improved cellular protection (decreased of LDH activity) 1 and 10 µg/mL respectively, in BT-Med+BT-TI group as compared to the UT-Med+UT-TI group. LDH has important role in the tissue injury, hemolysis, necrosis, hypoxia, or malignancies, however it plays a central role in maintenance of extracellular matrix for normal heart functioning and clinical importance in useful in living cells of blood cells, skeletal muscle, and heart muscle. Besides, HCF cells are used for the estimation of LDH activity, which represents heart health [50-52]. The present data concluded a significant reduction of LDH level after Biofield Energy Treatment and protection of the HCF cells, which would be useful in different pathological conditions.

Figure 3: The effect of the test formulation on the percent protection of HCF cells in terms of decreased Lactate Dehydrogenase (LDH) activity against tert-butyl hydroperoxide (t-BHP) induced damage.

Estimation of alanine amino transferase (ALT) activity in HepG2 cells

ALT activity was tested in HepG2 cells and the results are presented in terms of decreased ALT activity (Figure 4), which showed increased cellular protection of HepG2 cells. The positive control, silymarin was selected in ALT activity and the data suggested increased percentage cellular protection (decreased ALT activity) by 56%, 85%, and 118.9% at 5, 10, and 25 µM concentrations, respectively. Similarly, the test formulation groups showed improved cellular protection of HepG2 cells (decreased of ALT activity) by 25.4%, 30.5%, and 22.8% at 10, 25.5, and 63.75 µg/mL respectively in the UT-Med+BT-TI group, while increased cellular protection of HepG2 cells (decreased of ALT activity) by 29.1% and 74.9% at 10 and 63.75 µg/mL respectively, in the BT-Med+UT-TI group, and increased cellular protection of HepG2 cells (decreased of ALT activity) by 15.9%, 25.4%, and 84.9% at 10, 25.5, and 63.75 µg/mL respectively in the BT-Med+BT-TI group as compared to the UT-Med+UT-TI group (Figure 4). Liver has many enzymes among which ALT are one of the important in regulating various physiological processes. It has important function in cellular energy production and vital role in hepatocellular injury and death.
Altered in ALT enzyme represents liver or cellular damage [54]. The data showed significant increased cellular protection of HepG2 cells after Biofield Energy Treatment (The Trivedi Effect®), which significantly protects the liver hepatocytes that can be useful in liver cancer, liver cirrhosis, hepatomegaly, liver failure, and hepatitis.

Figure 4: The effect of the test formulation on the percent protection of human liver cancer (HepG2) cells in terms of decreased Alanine Amino Transaminase (ALT) activity under the stimulation of tert-butyl hydroperoxide (t-BHP).

Estimation of Superoxide Dismutase (SOD) activity in adenocarcinoma human alveolar basal epithelial cells (A549)

A549 cells were used for the estimation of SOD activity, and the results were represented in terms of increased cellular protection and the data was presented in Figure 5. The positive control, quercetin showed improved percentage increase in the SOD activity with respect to the t-BHP by 68.4%, 83.9%, and 104.2% at 10, 25, and 50µM concentration respectively. However, the percent protection of A549 (lungs) cells (increased of SOD activity) was significantly increased by 21.7% and 19.1% at 25.5 and 63.75 µg/mL respectively in the UT-Med+BT-TI group, while increased SOD activity by 83.2%, 33.1%, and 59.2% at 0.1, 25.5, and 63.75µg/mL respectively, in the BT-Med+UT-TI group, and increased SOD activity by 40% and 10% at 25.5 and 63.75µg/mL respectively, in the BT-Med+BT-TI group as compared to the UT-Med+UT-TI group (Figure 5). The data suggested that Biofield Energy Healing Treatment significantly improved the cellular protection of A549 cells and increased SOD enzyme in all the test groups. SOD acts as the body defense system that is responsible for high antioxidant activity against cellular damage due to free radicals, Reactive Oxygen Species (ROS), and many other factors causing cell death [55]. Biofield Energy Healing Treatment has significantly improved the SOD activity that can be used in various respiratory diseases such as pneumonia, asthma, pulmonary fibrosis, and lung cancer.

Figure 5: The effect of the test formulation on the percent protection of lungs cells (A549) in terms of increased SOD activity under the stimulation of tert-butyl hydroperoxide (t-BHP).

Data are expressed as mean±SD of three independent experiments.

Estimation of serotonin level in human neuroblastoma (SH-SY5Y) cells

The change in serotonin level was estimated in all the experimental groups using standard cell-based assay after 24 hours of treatment using ELISA method. Serotonin activity was in different test groups are presented in Figure 6. The positive control, curcumin showed 96.1%, 137.2%, and 169.6% increase the level of serotonin at 0.1, 1, and 5µM respectively, compared to the Vehicle Control (VC) group. The data showed significant increased serotonin level by 22.3%, 22%, and 50.8% at 10, 25, and 63.75µg/mL respectively, in the UT-Med+BT-TI, while significant increased
serotonin by 35.9% and 4.6% at 10 and 63.75µg/mL respectively, in the BT-Med+UT-TI, and 49.9%, 2.2%, and 14.1% improved serotonin level at 10, 25, and 63.75µg/mL respectively, in the BT-Med+BT-TI group as compared to the UT-Med+UT-TI group (Figure 6). Biofield Energy Healing Treatment significantly improved the serotonin (a neurotransmitter) level in all the groups, which can be used against various neurodegenerative diseases and improved brain functioning. Serotonin improves the mood and social behavior, appetite and digestion, sleep, memory, and sexual desire and related functions. It has important mechanism in the brain, bowels, and blood platelets. Serotonin inhibition leads to neuropsychiatric disorders such as emesis, Irritable Bowel Syndrome (IBS), and pulmonary and systemic hypertension, Alzheimer’s disease, cognitive health, loss of ability of thinking, migraine, depression, memory loss, etc. [56-59].

**Evaluation of Vitamin D Receptors (VDRs) activity in human bone osteosarcoma cells (MG-63)**

VDR activity was estimated using MG-63 cells and its expression was studies using the phenomenon of ligand binding through vitamin D active molecule that can be find out using quantitative-polymerase chain reaction (qPCR) amplification. Using real time PCR, different VDR-relative threshold cycle (VDR-CT) values were obtained after complete amplification cycles using specific primer probes. Relative Quantification (RQ) was calculated from the VDR-CT and housekeeping (HK)-CT values in MG-63 cells. The VDR-CT values of different experimental test groups are represented in Figure 7. Calcitriol was used as a positive control and the RQ of VDR was found to be increased in concentration-dependent manner by 59.1%, 93.2%, and 131.3% at 1, 10, and 100nM, respectively. The experimental test groups showed increased RQ of VDR expression by 91.2%, 62.4%, and 135.2% in the UT-Med+BT-TI group at 1, 10, and 50µg/mL respectively, while 184.3%, 242.4%, and 291.4% increased RQ of VDR at 1, 10, and 50µg/mL respectively, in the BT-Med+UT-TI group, and increased RQ of VDR by 196.2%, 289.8%, and 248.3% at 1, 10, and 50µg/mL respectively, in the BT-Med+BT-TI group as compared to the UT-Med+UT-TI group. The overall results showed significant increased RQ-VDR expression in MG-63 cells and improved vitamin activity after treatment in various groups. Calcitriol binds with the VDRs and extensively regulates the calcium homeostasis, immunity, overall cellular growth, bone growth, and differentiation [60-62]. The results were well collaborated and can be concluded that after treatment the activity of VDR expression was significantly improved.

**Figure 7:** Effect of the test formulation on percent increase in Relative Quantification (RQ) of Vitamin D Receptors (VDRs) gene in human bone osteosarcoma cells (MG-63).

**Conclusion**

The test formulation was found safe and non-toxic using standard MTT cell viability assay against tested cell lines. MTT assay showed that the test formulation was found safe all the tested cell lines. Cytotoxic activity against t-BHP induced cell damage was tested using Human Cardiac Fibroblasts Cells (HCF), which showed restoration of cell viability by 56.8% (at 63.75µg/mL), 57.5% (at
63.75µg/mL), and 124.8% (at 1µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, BT-Med+BT-TI groups respectively, as compared to the untreated test group, while in HepG2 cells the maximum restoration of cell viability by 83.2% (at 63.75µg/mL), 93.8% (at 63.75µg/mL), and 20.6% (at 10µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, BT-Med+BT-TI groups respectively, as compared to the untreated test group. Similarly, the test formulation in A549 cells showed maximum restoration of cell viability by 11.3% (at 25.5µg/mL), 82.7% (at 63.75µg/mL), and 113.9% (at 25.5µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. ALP activity in Ishikawa cells showed significantly increased ALP activity by 59.8% (at 0.1µg/mL), 269.7% (at 0.1µg/mL), and 105.7% (at 0.1µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Similarly, ALP activity in MG-63 cells with maximum cellular protection at 10µg/mL by 87.2%, 94.8%, and 94.2% in the UT-Med+BT-TI, BT-Med+UT-TI, BT-Med+BT-TI groups respectively, as compared to the untreated test group. LDH data was presented in terms of increased percentage cellular protection data, which suggested significant decreased activity, which showed maximum cellular protection by 48.8% (at 1µg/mL), 62.9% (at 10µg/mL), and 103% (at 1µg/mL) in the UT-Med + BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. ALT activity was studied and data showed maximum improved cellular protection of HepG2 cells (decreased of ALT activity) by 30.5% (at 25.5µg/mL), 74.9% (at 63.75µg/mL), and 84.9% (at 63.75µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. SOD activity was significantly increased by 21.7% (at 25.5µg/mL), 83.2% (at 0.1µg/mL), and 40% (at 25.5µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared with the untreated test group. Serotonin level was significantly increased in SH-SY5Y cells by 50.8% (at 63.75µg/mL), 35.9% (at 10µg/mL), and 49.9% (at 10µg/mL) in UT-Med+BT-TI, BT-Med+UT-TI, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. However, VDR expression was tested in MG-63 cells, which showed increased RQ of VDR by 91.2%, 184.3%, 242.4%, and 291.4% increased 62.4%, and 135.2% in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Serotonin level was significantly increased in SH-SY5Y cells by 50.8% (at 0.1µg/mL), 269.7% (at 0.1µg/mL), and 105.7% (at 0.1µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Similarly, serotonin level was significantly increased in SH-SY5Y cells by 50.8% (at 63.75µg/mL), 83.2% (at 0.1µg/mL), and 40% (at 25.5µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared with the untreated test group. VDR expression was tested in MG-63 cells, which showed increased RQ of VDR by 91.2%, 62.4%, and 135.2% in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. Similarly, VDR expression was tested in MG-63 cells, which showed increased RQ of VDR by 91.2%, 62.4%, and 135.2% in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. ALP activity in Ishikawa cells showed significantly increased ALP activity by 59.8% (at 0.1µg/mL), 269.7% (at 0.1µg/mL), and 105.7% (at 0.1µg/mL) in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group. VDR expression was tested in MG-63 cells, which showed increased RQ of VDR by 91.2%, 62.4%, and 135.2% in the UT-Med+BT-TI, BT-Med+UT-TI group, and BT-Med+BT-TI groups respectively, as compared to the untreated test group.
