Abstract

Fundamentals of Architectural Design is a compulsory basic course in the field of architecture, which requires certain craftsmanship and engineering thinking. It serves as an introductory practice course for students to learn architectural drawing. This paper explores and expands the practice of blended learning in professional education by utilizing the advantages of different teaching methods and aiming to enhance the cultivation of students' professional qualities.

Keywords: Architectural drawing; Integrated design; Blended learning

Course Design Concept and Framework

The educational pattern of “Two Financing and Four Entering, Five-level Progression” is the core of the construction of this course [1]. The content of “Architectural Drawing” is a microcosm of the course reform exploration. Based on this, this course is built on the foundation of “Architectural Drawing”, with “Moral Education and Talent Cultivation” as the center, and explores the teaching mode of “Blended Learning Reform, Integration and Complementarity of In-class and Out-of-class Learning”. The entire process follows the “P-C-D-I-O” teaching mode [2], aiming to achieve the unified educational goal of “Knowledge Dissemination, Ability Formation, Explicit Education of the Curriculum, and Implicit Ideological and Political Education”(Figure 1).

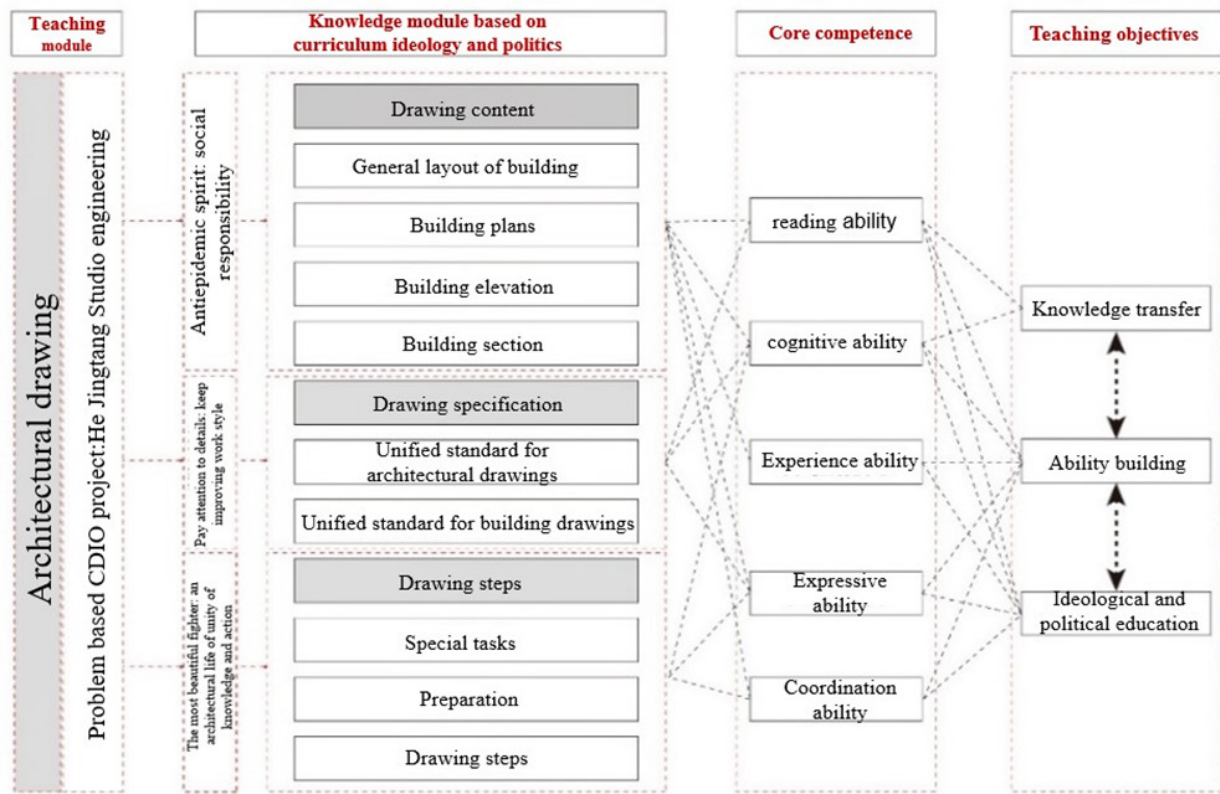

Figure 1: Classroom instructional design matrix.

Integration of implicit ideological and political education into design teaching practice inquiry-based teaching, cultivating students’ scientific and academic thinking

In the teaching process, teachers, based on teaching tasks and objective laws of learning, use various methods to inspire students’ thinking as the core, mobilize students’ learning initiative and enthusiasm, and guide students to actively explore through reading, observation, experiments, thinking, discussion, etc., discovering and mastering knowledge and skills on their own, which is a teaching philosophy that encourages lively and active learning. It is also an effective teaching method for teachers to guide students to master knowledge actively, positively, and consciously according to the objective laws of the learning process.

PCDIO teaching, cultivating students’ engineering and design thinking

Centered around students, using the PCDIO (Problem-Based Learning) and CDIO (Conceive-Design Implement-Operate) models [3], the course teaching procedure is optimized to enhance the exploration, interaction, innovation, and challenge of the course, cultivating students’ comprehensive ability to solve complex problems. Teachers guide the teaching process through “problem guidance, support, building, process organization, pointing out and correcting errors, assessment, and evaluation” to develop students’ comprehensive abilities to solve complex problems and design innovative thinking

Peer teaching, cultivating students’ engineering thinking

Students who perform exceptionally well in the course and have outstanding academic achievements (including senior students) are selected as peer teaching assistants. As a supplement to the teaching team, peer teaching assistants guide students by asking questions and inspiring them, and guide them to master the problem-solving approach [4]. Students participating in peer teaching projects are usually divided into multiple small groups, each consisting of 6-8 people, and learn in the form of group discussions, with one peer teaching assistant responsible for each group. As an organizer, the peer teaching assistant discusses the core knowledge of the course with the group members, helping them answer questions related to the course content.

Blended Teaching [5] Improves Students’ Independent Learning Abilities

In response to the post-pandemic era, the future trend in education lies in the multi-dimensional classroom format, which integrates information technology with traditional subject classrooms through innovative methods such as complementary online and offline resources. Learning can extend from the classroom and campus to places outside the classroom and campus (including virtual space). Blended teaching can amplify the characteristics of the subject, carry more educational functions, enhance students’ independent learning abilities, and better achieve the curriculum’s educational goals. It is convenient for personalized learning, such

as group discussions and individual tutoring. It also promotes the professional development of teachers and integrates online and offline training. Furthermore, it helps to highlight the features and standards of the curriculum.

Teaching Effectiveness and Reflection

Innovative teaching model improves the “Two Gender One Degree” of the curriculum

In this course, different teaching strategies were adopted in the classroom of teacher Cai, emphasizing the important role of student-centered, learning-centered, and participatory interaction in the process of teaching effectiveness. We value breaking the limitations of traditional classroom teaching content by attempting to enrich classroom forms, enliven classroom atmospheres, and expand new forms of curriculum teaching. The presentation method of the integration points adopted by different course teaching activity organization strategies is different, and students' sensory experience of knowledge acquisition is also different, which improves the teaching effectiveness of the classroom and realizes the entire process of curriculum education [6].

The course team has been focusing on the exploration and practice of blended teaching reform using digital technology for many years. Through three teaching cycles of practice, the course has improved its high-order, innovative, and challenging characteristics and summarized and refined the “PBL+CDIO Integration Innovation Architectural Design Foundation Blended Teaching Model.” The teaching effect is significant: emphasizing the internalization of the learned knowledge, broadening the vision, increasing knowledge, enhancing the understanding of theory, and more deeply affecting the ideological awareness and behavior of young college students.

Reflection

Curriculum-based ideological and political education is a new concept and model for contemporary universities to carry out ideological and political work. Curriculum education is the fundamental purpose of education [7,8]. Exploring the ideological and political elements contained in the curriculum, integrating ideological and political education into the entire process of professional course education and teaching, and achieving full-process education and all-around education are essential for creating a new situation in the development of China's higher education. In order to achieve this goal, the university actively explores the construction of a “professional course+curriculum for ideological and political education” double-integrated curriculum teaching system. The development and exploration process of the “Architectural Design Foundation” course of ideological and political education is full of harvest and expectations. Based on practice and focused on improving and upgrading, deeply reflecting on the double integration exploration of curriculum ideological and political education and professional education will help to continue

the comprehensive promotion and high-quality development of curriculum ideological and political education.
